Wavelet Implementation for 1D and 2D Data

Author:
Aliakbar Zarkoob

Professor:
Dr. Abdolreza Safari

Autumn 2024

1 Introduction

Wavelet analysis has become a fundamental tool in signal processing, data compression, and various fields of scientific research due to its ability to reveal information across different scales and resolutions. Unlike Fourier analysis, which primarily focuses on the frequency domain, wavelet transforms allow for simultaneous analysis in both the time/space and frequency domains. This dual-domain capability makes wavelets especially useful for analyzing non-stationary signals or images where features of interest may vary in size or frequency.

Wavelet transforms can be applied to both one-dimensional (1D) and two-dimensional (2D) data, providing significant versatility. In 1D data, wavelet analysis is commonly used for tasks such as noise reduction and feature extraction in time-series data, while in 2D data, it is widely utilized for image compression, edge detection, and texture analysis.

2 One-Dimensional Wavelets

Assuming that a 1D signal like equation 1 exists, where n is a power of 2. The aim in wavelet transform is to reconstruct the signal with smooth and detail parts, as shown in equation 2. These two parts can be calculated by the equations 3 and 4, where k indicates the level of decomposition.

$$f = (f_1, f_2, f_3, \dots, f_n) \quad (1)$$

$$f = \sum_{i=1}^{\frac{N}{2^j}} \langle f, V_i^1 \rangle V_i^1 + \sum_{j=1}^{\frac{N}{2^j}} \sum_{i=1}^{2^j} \langle f, W_i^j \rangle W_i^j \quad (2)$$

$$\begin{aligned} s_i^k &= f \cdot V_i^k \\ d_i^k &= f \cdot W_i^k \end{aligned} \quad (3)$$

$$\begin{aligned} S^k &= s_1^k \cdot V_1^k + s_2^k \cdot V_2^k + \dots + s_i^k \cdot V_i^k \\ D^k &= d_1^k \cdot W_1^k + d_2^k \cdot W_2^k + \dots + d_i^k \cdot W_i^k \end{aligned} \quad (4)$$

V and W in the equation 2 are basis vectors that create the smooth and detail spaces. These basis vectors are created based on scaling function $\phi(x)$ and wavelet function $\psi(x)$. How these two functions are defined, separates different types of wavelets. In this report, 5 types of wavelets are used (Haar, Daubechies4, Daubechies6, Mexican Hat and Symlet3).

2.1 Haar Wavelet

The scaling and wavelet function for Haar wavelet is defined as below. The basis vectors V and W are created with coefficients h and g . These basis vectors for the first level of decomposition are shown in the equations 7 and 8.

$$\phi(x) = \begin{cases} 1 & 0 \leq x < 1 \\ 0 & \text{otherwise} \end{cases} \quad (5)$$

$$\psi(x) = \begin{cases} 1 & 0 \leq x < \frac{1}{2} \\ -1 & \frac{1}{2} \leq x < 1 \\ 0 & \text{otherwise} \end{cases} \quad (6)$$

$$\begin{aligned} V_1^1 &= (h_0, h_1, 0, 0, \dots, 0, 0) \\ V_2^1 &= (0, 0, h_0, h_1, \dots, 0, 0) \\ &\vdots \\ V_{\frac{n}{2}}^1 &= (0, 0, 0, 0, \dots, h_0, h_1) \end{aligned} \quad (7)$$

$$\begin{aligned} h_0 &= \frac{1}{\sqrt{2}} , \quad h_1 = \frac{1}{\sqrt{2}} \\ W_1^1 &= (g_0, g_1, 0, 0, \dots, 0, 0) \\ W_2^1 &= (0, 0, g_0, g_1, \dots, 0, 0) \\ &\vdots \\ W_{\frac{n}{2}}^1 &= (0, 0, 0, 0, \dots, g_0, g_1) \end{aligned} \quad (8)$$

$$g_0 = \frac{1}{\sqrt{2}} , \quad g_1 = -\frac{1}{\sqrt{2}}$$

2.2 Daubechies4 Wavelet

The basis vectors V and W for the first level of decomposition are created as shown in the equations 9 and 10.

$$\begin{aligned} V_1^1 &= (h_0, h_1, h_2, h_3, 0, 0, 0, 0, \dots, 0, 0, 0, 0) \\ V_2^1 &= (0, 0, h_0, h_1, h_2, h_3, 0, 0, \dots, 0, 0, 0, 0) \\ &\vdots \\ V_{\frac{n}{2}}^1 &= (h_2, h_3, 0, 0, 0, 0, 0, 0, \dots, 0, 0, h_0, h_1) \end{aligned} \quad (9)$$

$$\begin{aligned} h_0 &= \frac{1 + \sqrt{3}}{4\sqrt{2}} , \quad h_1 = \frac{3 + \sqrt{3}}{4\sqrt{2}} , \quad h_2 = \frac{3 - \sqrt{3}}{4\sqrt{2}} , \quad h_3 = \frac{1 - \sqrt{3}}{4\sqrt{2}} \\ W_1^1 &= (g_0, g_1, g_2, g_3, 0, 0, 0, 0, \dots, 0, 0, 0, 0) \\ W_2^1 &= (0, 0, g_0, g_1, g_2, g_3, 0, 0, \dots, 0, 0, 0, 0) \\ &\vdots \\ W_{\frac{n}{2}}^1 &= (g_2, g_3, 0, 0, 0, 0, 0, 0, \dots, 0, 0, g_0, g_1) \end{aligned} \quad (10)$$

$$g_0 = h_3 , \quad g_1 = -h_2 , \quad g_2 = h_1 , \quad g_3 = -h_0$$

2.3 Daubechies6 Wavelet

The basis vectors V and W for other wavelets are created in the same manner, but the h and g coefficients are different. these coefficients for Daubechies6 are shown in the equations 11 and 12.

$$\begin{aligned} h_0 &= 0.3326705529500826, h_1 = 0.8068915093110928 \\ h_2 &= 0.4598775021184915, h_3 = -0.1350110200102546 \\ h_4 &= -0.0854412738822415, h_5 = 0.0352262918857095 \end{aligned} \quad (11)$$

$$\begin{aligned} g_0 &= h_5, g_1 = -h_4, g_2 = h_3 \\ g_3 &= -h_2, g_4 = h_1, g_5 = -h_0 \end{aligned} \quad (12)$$

2.4 Mexican Hat Wavelet

The h and g coefficients for Mexican Hat Wavelet are shown in the equations 13 and 14.

$$\begin{aligned} h_0 &= \frac{1 - \sqrt{7}}{16\sqrt{2}}, h_1 = \frac{5 + \sqrt{7}}{16\sqrt{2}}, h_2 = \frac{14 + 2\sqrt{7}}{16\sqrt{2}} \\ h_3 &= \frac{14 - 2\sqrt{7}}{16\sqrt{2}}, h_4 = \frac{1 - \sqrt{7}}{16\sqrt{2}}, h_5 = \frac{-3 + 2\sqrt{7}}{16\sqrt{2}}, \end{aligned} \quad (13)$$

$$\begin{aligned} g_0 &= h_5, g_1 = -h_4, g_2 = h_3 \\ g_3 &= -h_2, g_4 = h_1, g_5 = -h_0 \end{aligned} \quad (14)$$

2.5 Symlet3 Wavelet

The h and g coefficients for Mexican Hat Wavelet are shown in the equations 15 and 16.

$$\begin{aligned} h_0 &= 0.3326705529500826, h_1 = 0.8068915093133388 \\ h_2 &= 0.4598775021184915, h_3 = -0.1350110200102546 \\ h_4 &= -0.0854412738820267, h_5 = 0.0352262918857095 \end{aligned} \quad (15)$$

$$\begin{aligned} g_0 &= -h_5, g_1 = h_4, g_2 = -h_3 \\ g_3 &= h_2, g_4 = -h_1, g_5 = h_0 \end{aligned} \quad (16)$$

3 Two-Dimensional Wavelets

Assuming that an $m \times n$ image like equation 17 exists, where m and n are powers of 2. Unlike the case of 1D signal that two parts of smooth and detail existed, here there are four parts, shown in equation 19 where k indicates the decomposition level.

$$f = \begin{bmatrix} f_{11} & f_{12} & \dots & f_{1n} \\ f_{21} & f_{22} & \dots & f_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ f_{m1} & f_{m2} & \dots & f_{mn} \end{bmatrix} \quad (17)$$

$$\left[\begin{array}{c|c} ss^k & sd^k \\ \hline ds^k & dd^k \end{array} \right] \quad (18)$$

The basis elements for creating these four parts are the outer product of the V and W vectors defined in one-dimensional wavelets. These four parts can be constructed with the equations 19 and 20.

$$\begin{aligned} ss_{ij}^k &= f \cdot (V_{ij}^k \otimes V_{ij}^k) \\ sd_{ij}^k &= f \cdot (V_{ij}^k \otimes W_{ij}^k) \\ ds_{ij}^k &= f \cdot (W_{ij}^k \otimes V_{ij}^k) \\ dd_{ij}^k &= f \cdot (W_{ij}^k \otimes W_{ij}^k) \end{aligned} \quad (19)$$

$$\begin{aligned} SS^k &= ss_{11}^k V_1^k \otimes V_1^k + ss_{12}^k V_1^k \otimes V_2^k + \dots + ss_{\frac{m}{2} \frac{n}{2}}^k V_{\frac{m}{2}}^k \otimes V_{\frac{n}{2}}^k \\ SD^k &= sd_{11}^k V_1^k \otimes W_1^k + sd_{12}^k V_1^k \otimes W_2^k + \dots + sd_{\frac{m}{2} \frac{n}{2}}^k V_{\frac{m}{2}}^k \otimes W_{\frac{n}{2}}^k \\ DS^k &= ds_{11}^k W_1^k \otimes V_1^k + ds_{12}^k W_1^k \otimes V_2^k + \dots + ds_{\frac{m}{2} \frac{n}{2}}^k W_{\frac{m}{2}}^k \otimes V_{\frac{n}{2}}^k \\ DD^k &= dd_{11}^k W_1^k \otimes W_1^k + dd_{12}^k W_1^k \otimes W_2^k + \dots + dd_{\frac{m}{2} \frac{n}{2}}^k W_{\frac{m}{2}}^k \otimes W_{\frac{n}{2}}^k \end{aligned} \quad (20)$$

4 Implementations

4.1 One-Dimensional

4.1.1 Noise Reduction

A 1D signal is created with the equation 21. Then white noise with the standard deviation of 1 is added to the signal. the created signal before and after adding noise is shown in the figure 1.

$$f(x) = 2x^2 + 10 \sin(4x) + \cos^2(x^2) \quad (21)$$

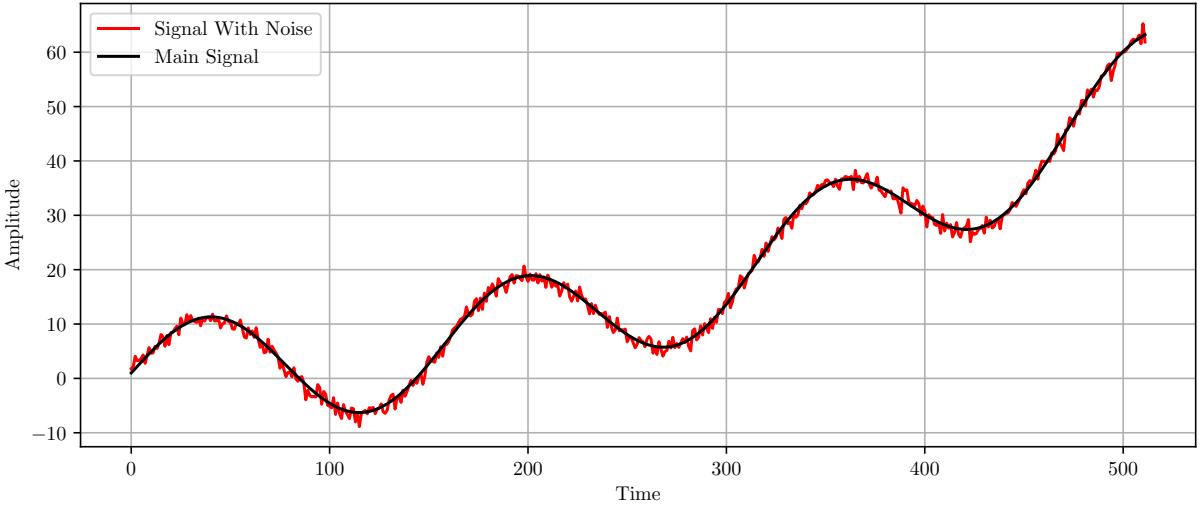

Figure 1: Constructed 1D signal, before and after adding white noise.

The results for 5 mentioned wavelets are shown in the figures 2 to 6.

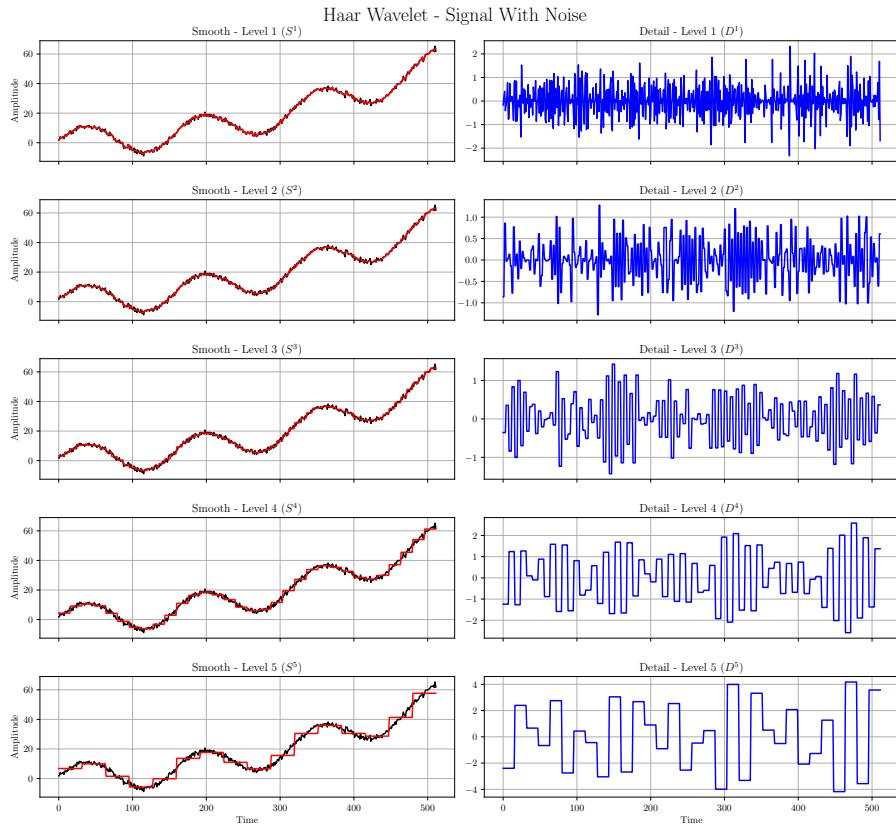

Figure 2: Results of Haar wavelet on the simulated signal.

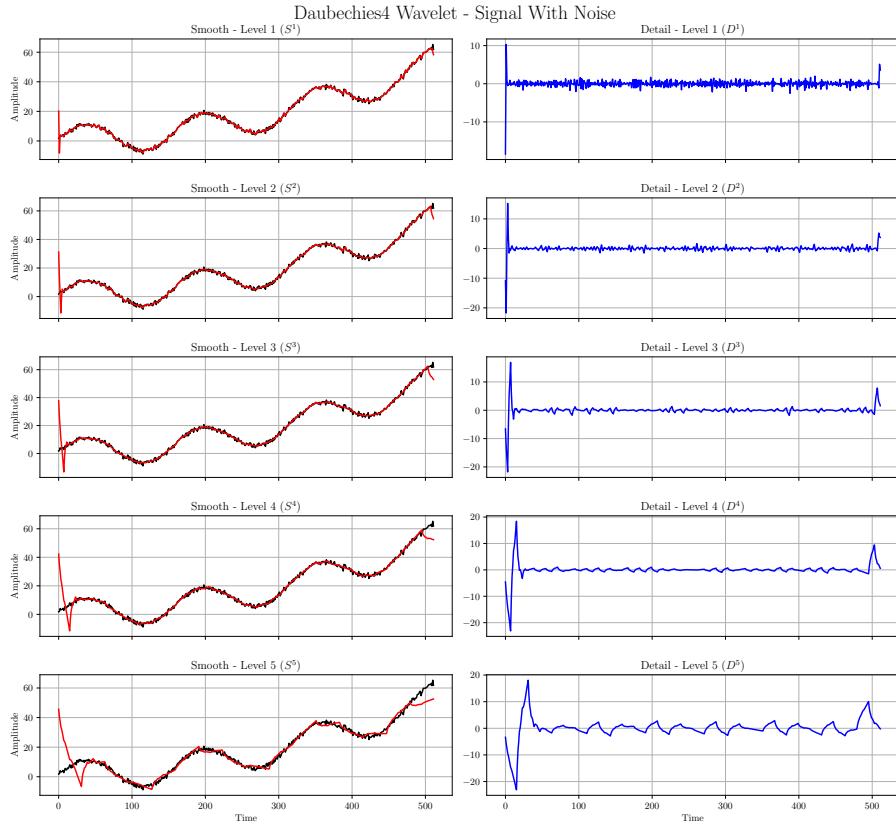

Figure 3: Results of Daubechies4 wavelet on the simulated signal.

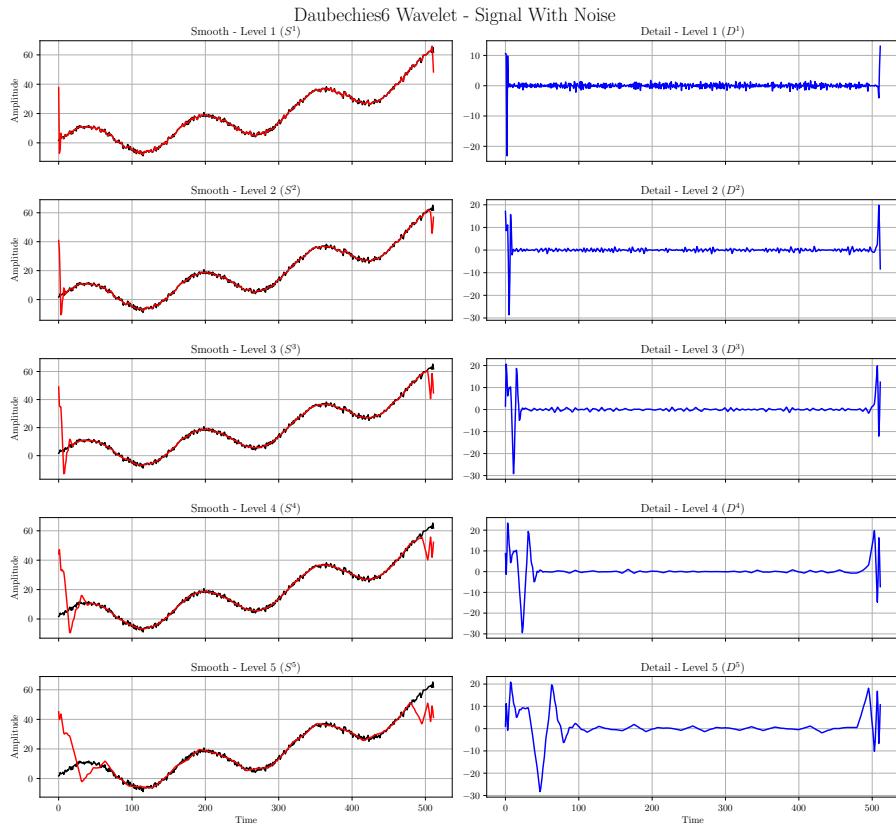

Figure 4: Results of Daubechies6 wavelet on the simulated signal.

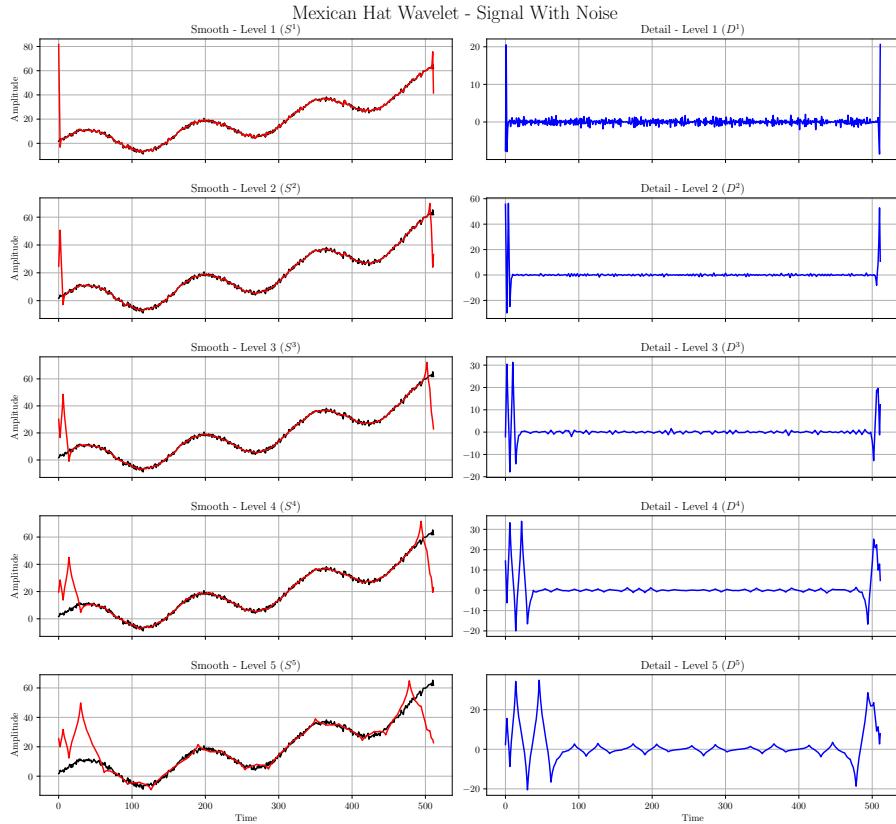

Figure 5: Results of Mexican Hat wavelet on the simulated signal.

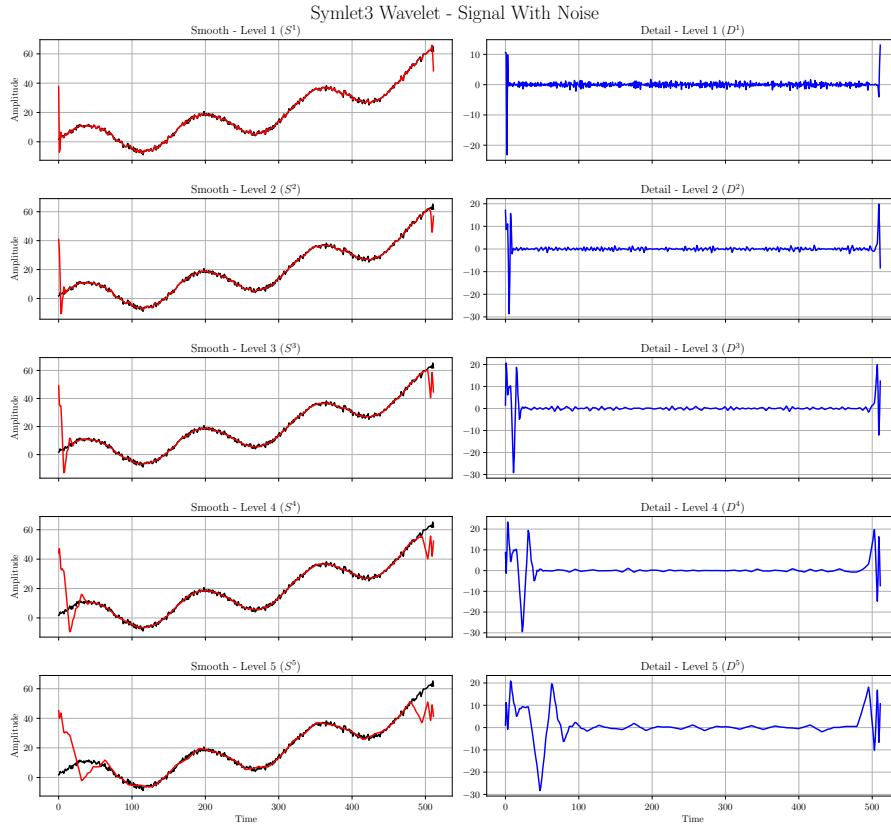

Figure 6: Results of Symlet3 wavelet on the simulated signal.

For checking the results of each wavelets used, difference between the main signal is calculated from the equation 22.

$$e^k = \|f - D^k\|_2 \quad (22)$$

Table 1: Error for used wavelets.

Level	Haar	Daubechies4	Daubechies6	Mexican Hat	Symlet3
1	18.4707	28.4802	45.5117	92.1182	45.5119
2	14.9577	39.4772	61.5268	94.2667	61.5268
3	18.4413	57.2383	93.5517	119.8591	93.5517
4	33.5126	82.9160	126.2475	151.4533	126.2475
5	65.3029	120.1642	162.3870	201.8784	162.3870

As shown in the table 1, best result was achieved with level 2 of Haar Wavelet.

4.1.2 GNSS Signal Cycle Slip Detection

The studied signal is for GPS PRN03 which is shown in the figure 7. Results for 5 mentioned wavelets are shown in the figures 8 to 12.

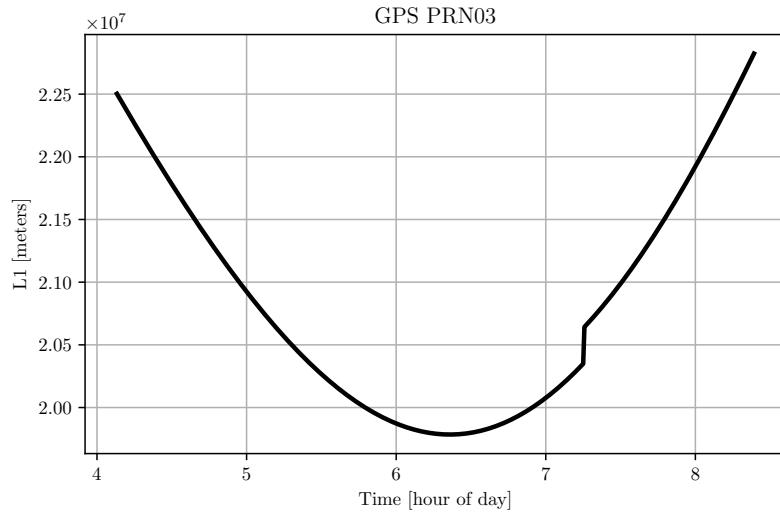

Figure 7: GPS signal with cycle slip.

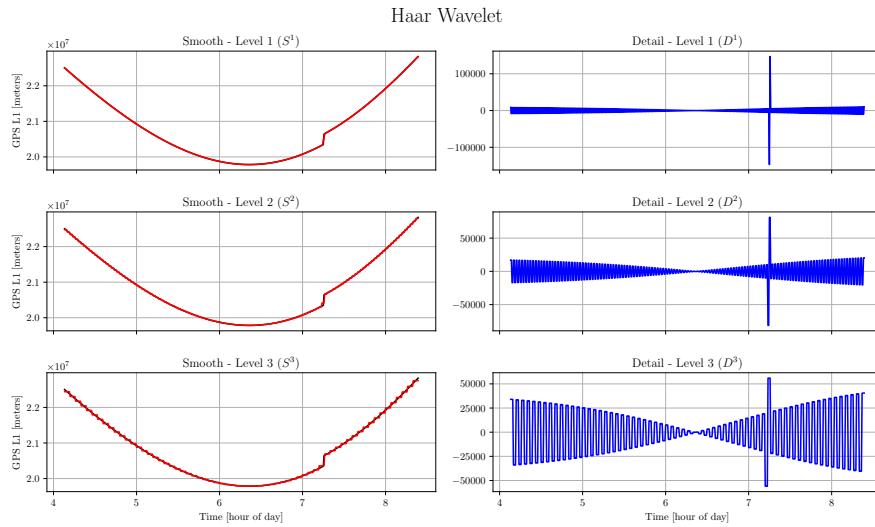

Figure 8: Results of Haar wavelet on GPS signal.

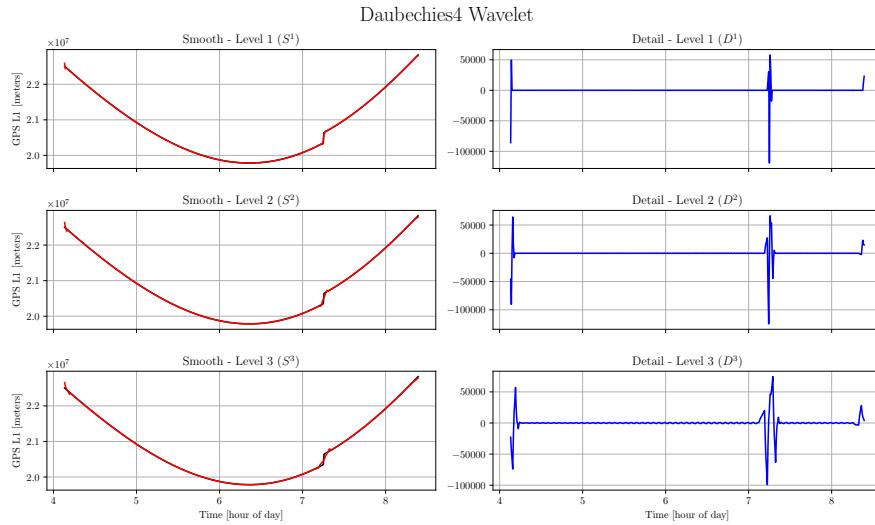

Figure 9: Results of Daubechies4 wavelet on GPS signal.

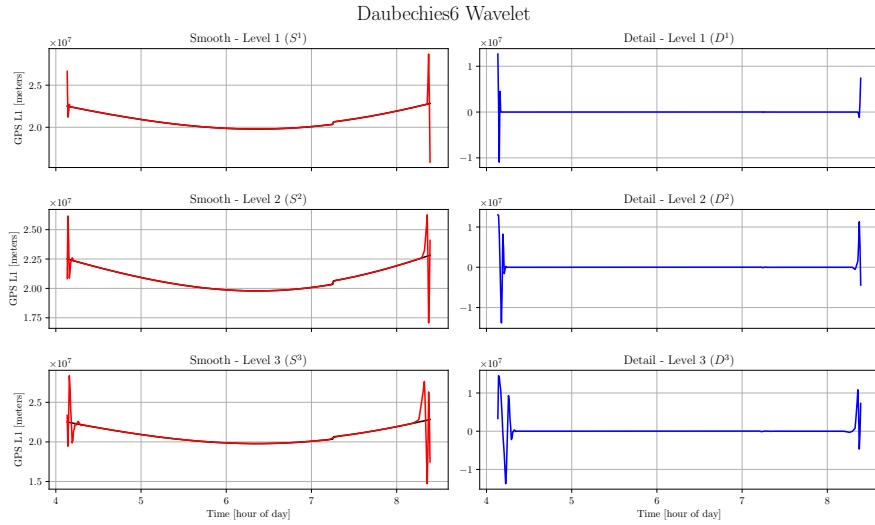

Figure 10: Results of Daubechies6 wavelet on GPS signal.

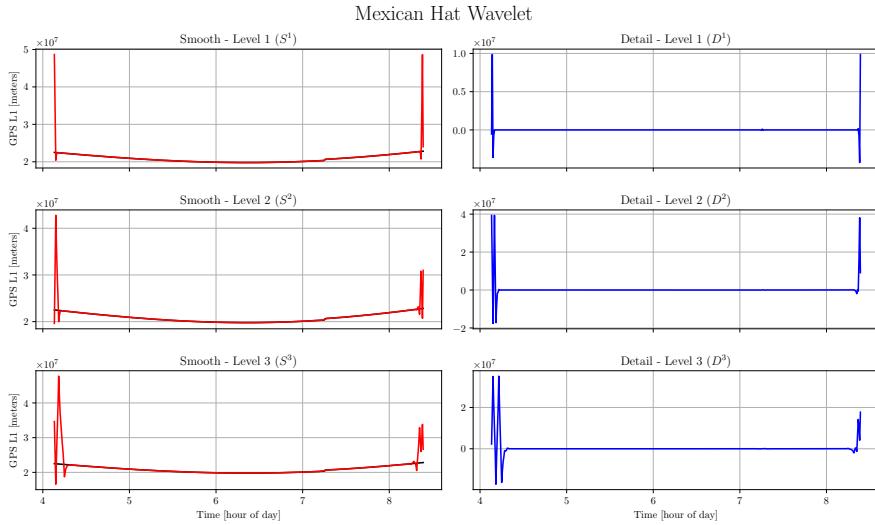

Figure 11: Results of Mexican Hat wavelet on GPS signal.

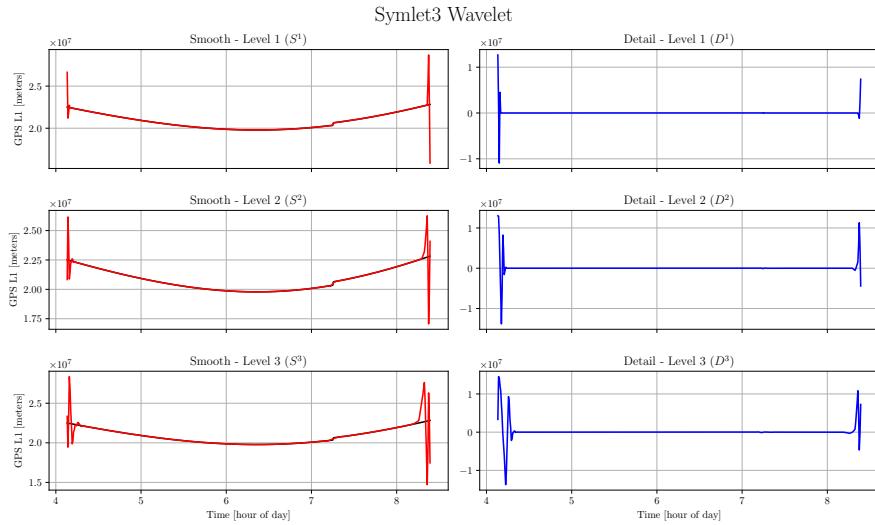

Figure 12: Results of Symlet3 wavelet on GPS signal.

As it's understandable from the figures, cycle slip can only be seen in the detail parts of Haar and Daubechies4. By finding the absolute maximum value of detail part in level 1 for the mentioned wavelets, cycle slip has happened in the time index of 374 (7.25 hour of day).

4.2 Two-Dimensional

The studied Image is shown in figure 13. Two types of noise are added to this image (salt&pepper and Gaussian). Results for different types of wavelets are shown in the figures 14 to 28

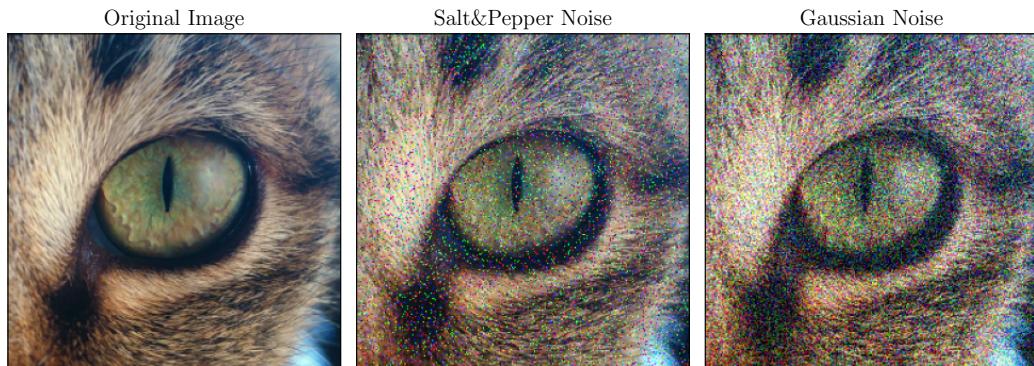

Figure 13: Original image alongside noisy images.

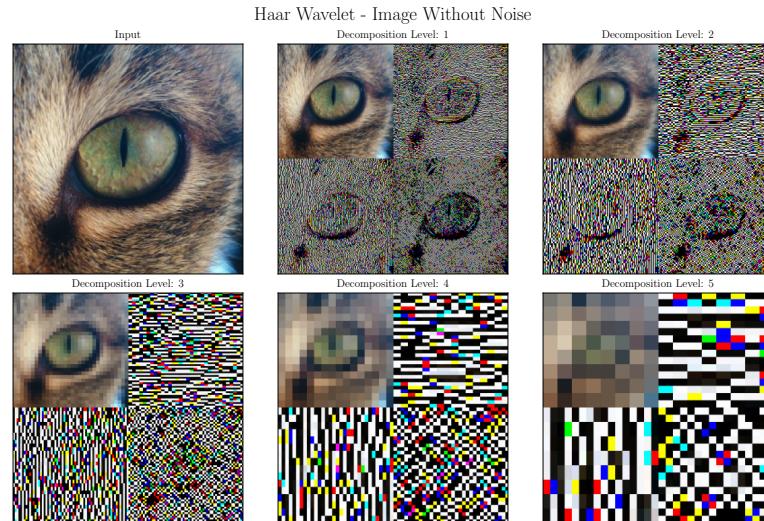

Figure 14: Results of Haar wavelet on original image.

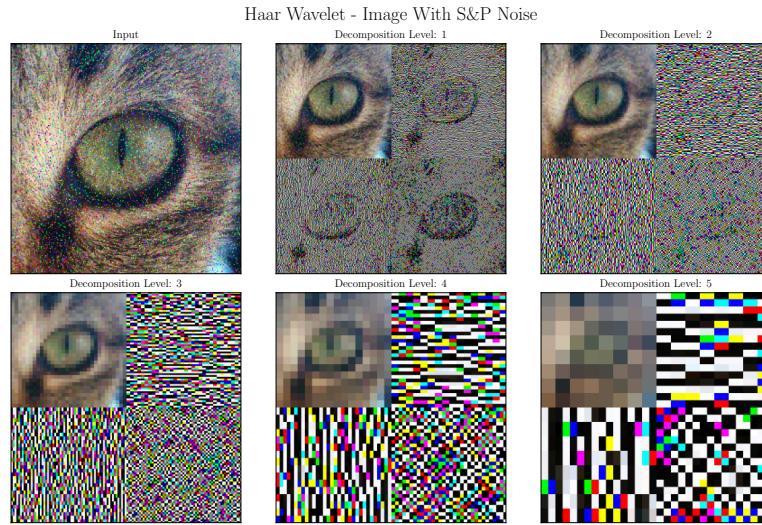

Figure 15: Results of Haar wavelet on image with s&p noise.

Figure 16: Results of Haar wavelet on image with Gaussian noise.

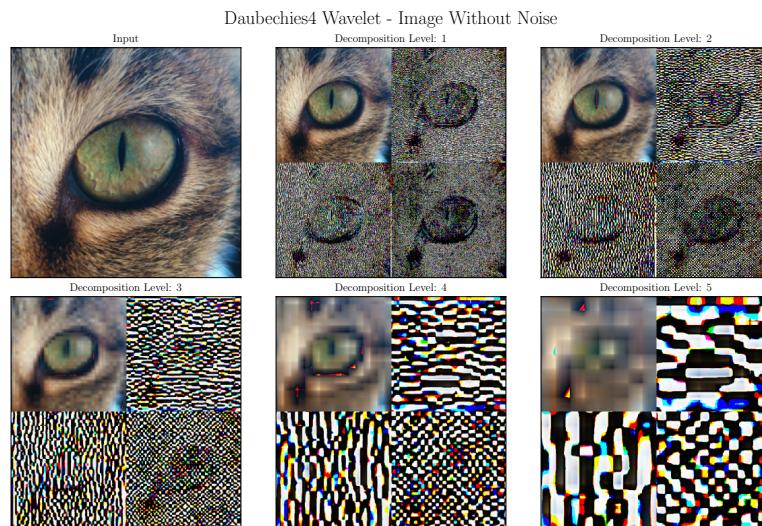

Figure 17: Results of Daubechies4 wavelet on original image.

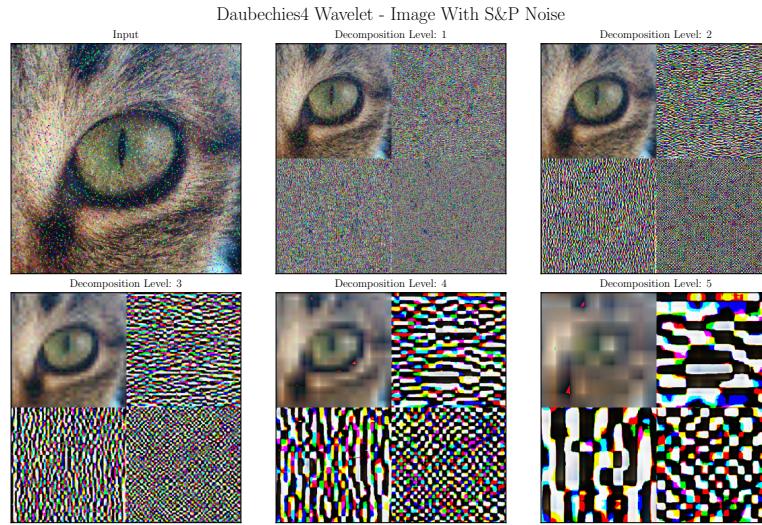

Figure 18: Results of Daubechies4 wavelet on image with s&p noise.

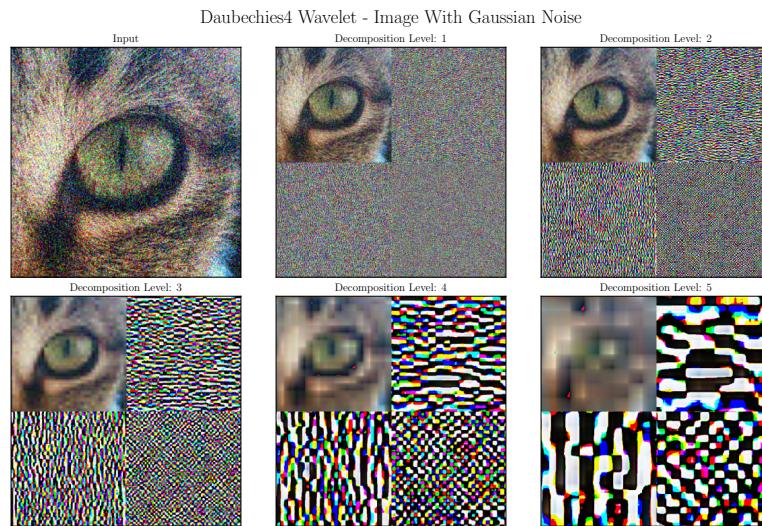

Figure 19: Results of Daubechies4 wavelet on image with Gaussian noise.

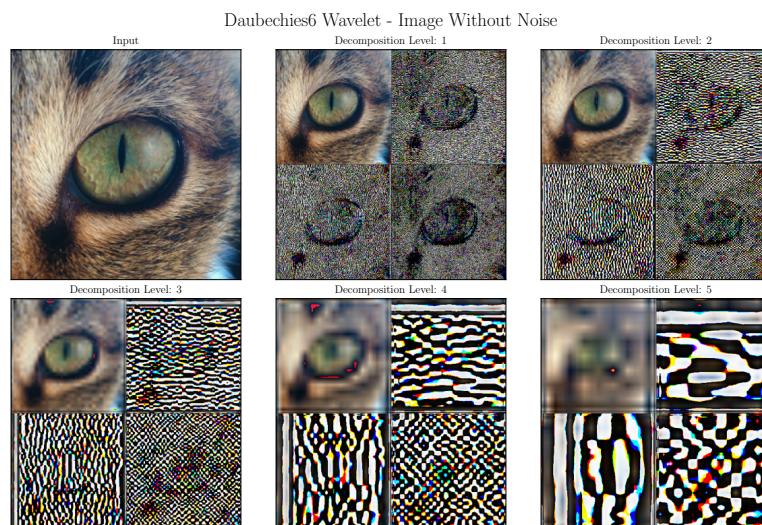

Figure 20: Results of Daubechies6 wavelet on original image.
